Refer to the below passage and answer the questions.

Rainforests are essential resources for our planet, providing us with valuable medicines, foods, and natural insecticides. They are also a habitat for millions of animals, plant, and insect species, many of which are yet to be discovered. The destruction of rainforests through logging, colonization, and cattle ranching is resulting in the loss of species, erosion of fertile land, and decline in the world's oxygen supply. The first cause of mass destruction of rainforests is logging. The need for commercially valuable trees such as mahogany and tropical cedar leads to bulldozing roads through the forest, taking down other trees in the process. When one commercially valuable tree is cut down, on average, 17 non-commercially valuable trees also fall. The logging industry can eradicate 30% of a rainforest where only a few commercially valuable trees were cut down, and this rate can lead to the clearing out of entire rainforests in a few years.

The destruction of rainforests is resulting in the loss of millions of animals, plant, and insect species.. The loss of species and destruction of fertile land has a significant impact on the world's oxygen supply. Rainforests are responsible for a significant portion of the world's oxygen, and the destruction of rainforests ultimately leads to the destruction of our own oxygen supply.

In conclusion, the rainforest is an essential resource for our planet and contains many undiscovered possibilities. However, the destruction of rainforests through logging, colonization, and cattle ranching is leading to the loss of millions of species, eroded and infertile land, and a decline in the world's oxygen supply. It is essential that we take action to save rainforests to protect our planet and prevent further damage to the environment.
